

SIMATS ENGINEERING
ASSESSMENT TOOL 3 – VIVA QUESTIONS

Priya dharshini M (192521051)

COURSE OUTCOME COVERED

***CO5:** Analyse vulnerabilities in Windows and Linux systems and evaluate security weaknesses in messaging, web, and mobile applications using appropriate exploitation techniques and hacking tools. (BT5)*

QUESTION AND ANSWER

1. How would you evaluate the security posture of a Windows system after identifying multiple open services?

Answer: I would identify the services and their versions, check for known vulnerabilities, and determine whether they are necessary. Unnecessary services should be disabled or restricted.

3. How would you evaluate the security risk associated with an exposed RPC service?

Answer: I would check whether the RPC service is accessible to unauthorized users and whether it has known vulnerabilities. If it can lead to unauthorized access, the risk is high.

4. Why are Windows Null Sessions considered a security weakness, and how would you assess their impact?

Answer: Null Sessions may allow unauthenticated users to collect information about a Windows system. This information could help an attacker perform further attacks.

9. How would you evaluate the security risks of unconnected or unnecessary services running on a Linux system?

Answer: I would identify unnecessary services, check their ports and vulnerabilities, and disable or restrict them. Unnecessary services increase the attack surface.

17. A web application is vulnerable to SQL injection. How would you evaluate the severity of this vulnerability and its possible consequences?

Answer: I would check what data or database functions could be affected. If sensitive data can be accessed or modified, the vulnerability would be considered high risk
